

How to use node text autofill

1. Open the runner.exe in the dist folder
2. After you open the application you will be prompted to enter the sms text. You can simulate (shift + enter) key presses by using ' a delimiter.
3. To select a variable correctly using this method you must enter the full variable name and simulate a (shift + enter) to select the variable and then continue as shown below.

```
C:\Projects\test\dist\runner.e
(use ' for line breaks ' ' for multiple line breaks. Eg: Dear representative of @applicantName ' , ' ' Contents of the m
eessage.)
Enter text for SMS:
dear @test ' , ' ' Contents of the sms|
```

The **underlined** delimiter (') is used to simulate an enter key press, to select the variable after typing out the variable name. After that the comma is entered as the last text of that line and then the delimiter is used twice to give 2 line breaks (shift + enter).

4. The delimiter should always have a space both behind and infront as shown below, otherwise it will be entered as a text.
5. After you finish entering the text for both Email and SMS you are now ready to start using the shortcuts.

6. Click on any text area / text box and then use the desired shortcut to execute the text pasting.
7. Ctrl + alt + R is for SMS
8. Ctrl + alt + F is for Email

Things to keep in mind when using this app

- Do **NOT** make any inputs while the app is typing. Wait until it is done
- Make sure to click the text box to focus on it **before** using the shortcut
